

Hi there!

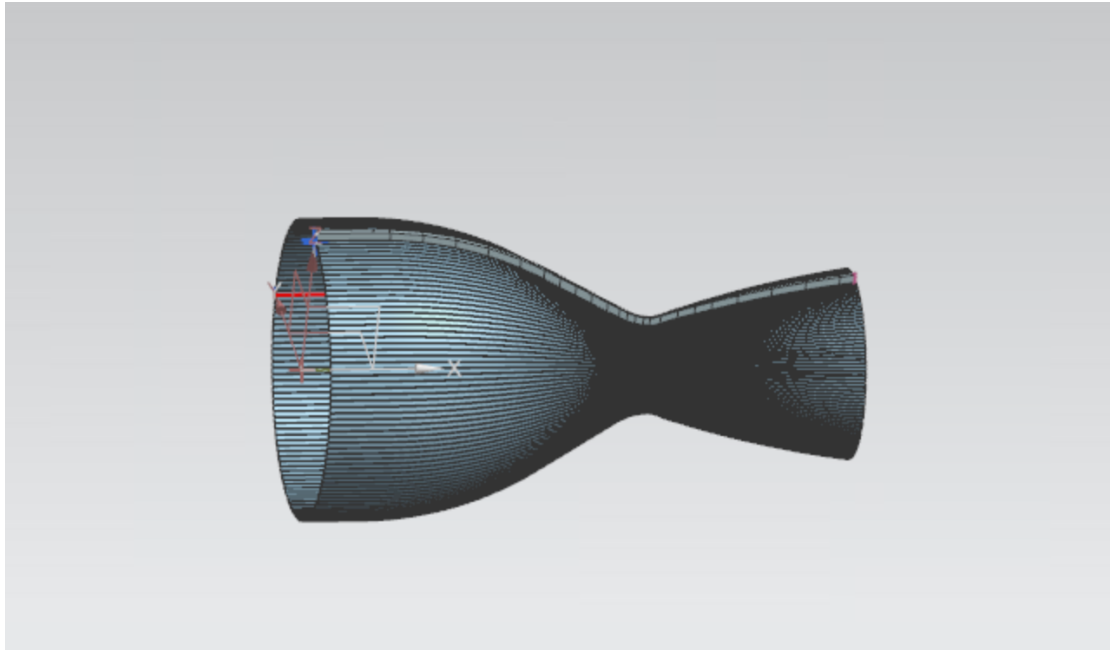

My name is Ian, and I want to thank you for looking at my portfolio. I have been working on some exciting projects—I am eager to show you what I am capable of. Below is a list of my recent projects and a brief description.

1. CAD

I have devoted an hour a day for the past six weeks to teaching myself how to use Siemens NX. I have been working with a textbook that a colleague lent me, called *Siemens NX 12.0 for Designers, 11<sup>th</sup> Edition* by Sham Tickoo. I have recently learned how to create assemblies of components. Below is a picture of a pipe vice which I created during a tutorial in the book.

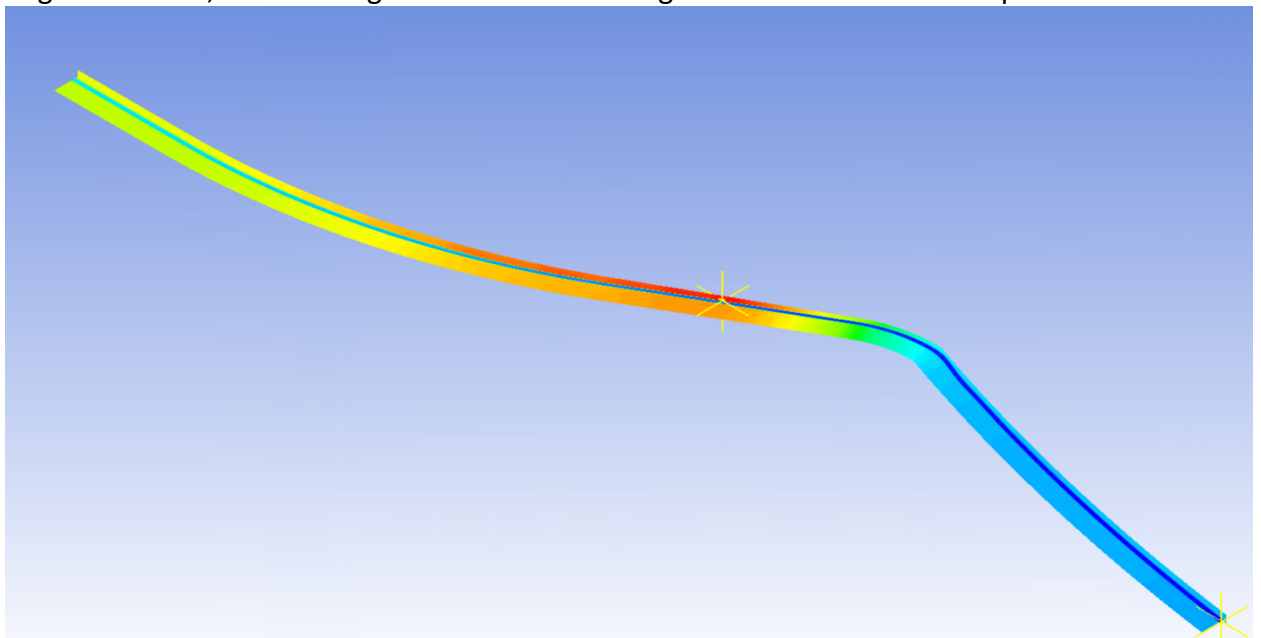

I have been getting increasingly comfortable with NX. I am now able to work with the model for the combustion chamber cooling system my team and I are currently designing with THRUST—a student-led high powered rocketry organization here at the University of Illinois which I belong to.

*Model of the fluid negative of the Tacoma cooling system*

## 2. ANSYS

To simulate the cooling process within our engine accurately, we have decided to use finite element analysis. Hence, I was tasked with learning how to use ANSYS Fluent and Mesher. I have successfully used ANSYS to model the thermal environment in our engine bell wall, determining that our current design would not meet our requirements.

*Temperature of Engine Wall Cross-Section*

### 3. C/C++

During the stay-at-home order in my state, I learned C and C++. I enrolled in an online course (through Coursera) to learn C, called "C for Everyone." Once I finished that course, I moved on to C++, enrolling in a course titled "C++ for C Programmers." This course was challenging, culminating with a project in which I had to implement a random graph generation algorithm, Dijkstra's algorithm, Prim's algorithm, and Kruskal's algorithm. During this project, I learned the principles of Object-Oriented programming, code readability, and memory management. To view the source code of this project, please visit <https://github.com/iamianbrown/Graph-Project>.
